

CHSC6410 STUDENT LEARNING OBJECTIVES:

Upon satisfactory completion of this course, the student will be able to:

- Explain the physiological, psychological and social issues that impact a woman's obstetrical, gynecological and reproductive health.
- Differentiate normal physiological and psychological changes experienced during pregnancy from complications experienced during pregnancy.
- Describe the clinical management of the woman during the intrapartum period.
- Describe the clinical management issues of the neonate and woman during the postpartum period.
- Explain the mode of action, physiological effects, and potential complications of the various contraceptive methods.
- Discuss issues related to male and female infertility.
- Discuss cultural, ethical and legal issues related to family planning.
- Discuss policy and public health issues that impact the maternal and reproductive health care of women.
- Conduct a professional presentation on a maternal or reproductive public health issue.
- Demonstrate an understanding of the importance of the knowledge, social strategies, and political will, in shaping public health policy and practice with regard to maternal and reproductive health.
